ABSTRACT
Bacopa monniera also referred to as Bacopa monnieri, Herpestis monniera, water hyssop, and “Brahmi,” has been used in the Ayurvedic system of medicine for centuries. Phytochemical analysis of B. monniera plant extracts revealed the presence of various biochemical compounds such as alkaloids, bacosides, flavonoids, glycosides, triterpenoids and saponins etc. Our present work aims at investigating the in-vitro anti-arthritic effect of B. monniera at various concentrations. The inhibition of protein denaturation and membrane stabilisation were taken as a measure of the in-vitro anti-arthritic activity. The maximum percentage inhibition of protein denaturation and membrane stabilisation for B. monnieri extracts were found to be 90.34±0.83% and 93.67±1.34% respectively at a dose of 2000 µg/ml. When compared to standard Diclofenac sodium was found out to be 96.52±1.25% and 98.76±1.67% respectively at a dose of 2000 µg/ml. Therefore, our studies support the isolation and the use of active constituents from B. monnieri in treating arthritis.

Keywords: Bacopa monniera, anti-arthritic activity, Diclofenac sodium, triterpenoids, bacosides.

INTRODUCTION
About 1% of the world’s population is afflicted by rheumatoid arthritis, women three times more often than men. Rheumatoid arthritis is a chronic, systemic inflammatory disorder that may affect many tissues and organs, but principally attack synovial joints [1, 2]. The production of auto antigens in certain arthritic diseases may be due to in vivo denaturation of proteins [3]. The mechanism of denaturation probably involves alteration in electrostatic, hydrogen, hydrophobic and disulphide bonding [4]. So, by controlling the production of auto antigen and inhibiting denaturation of protein and membrane lysis in rheumatic disease leads to anti-arthritic activity. Hence, inhibition of protein denaturation and membrane lysis were taken as a measure of the in vitro anti-arthritic activity. A larger number of herbal extracts are in vogue for the treatment of various types of arthritis.

Bacopa monniera (Family-Scrophulariaceae) is a creeping, succulent herb, rooting at nodes, distributed throughout India in all plain districts, ascending to an altitude of 1,320m [5, 6]. Brahmi is also known as “Medhya Rasayana” in Ayurveda as it increases mental clarity and brain stimulating action [7]. It also possesses anti-inflammatory, analgesic, antipyretic, epilepsy, anticancer and antioxidant activities [8, 9]. The medicinal properties of B. monnieri responsible for improving memory-related functions have been attributed to the presence of different types of saponins such as bacosides A, B, C and D which are the active triterpenoid principles and known as "memory chemicals”[10]. Our present work aims at evaluating the anti-arthritic effect of B. monniera at various concentrations by using in-vitro pharmacological models.

MATERIALS AND METHODS
Collection of Plant Material
The fresh whole plant of Bacopa monniera was collected from Araku valley situated near Visakhapatnam, Andhra Pradesh, India.

Chemicals
All chemicals and reagents were of analytical grade or purest quality.

Extraction and Preparation of methanolic extracts
10 gm of powder of the plant was packed in thimble flask and 250ml of methanol was added in 1 litre round bottom flask. Then the Soxhlet assembly was set up to complete 10 to 15 cycles. The solvent was distilled at lower temperature under reduced pressure, after that the extract was filtered and filtrate was concentrated using water bath to get the crude extract which is stored in freezer for future use. The percentage yield of methanolic extract of Bacopa monniera is 15.47 %.
Inhibition of Protein Denaturation

The following procedure was followed for evaluating the percentage of inhibition of protein denaturation-

1. Test solution (0.5ml) consist of 0.45ml of Bovine serum albumin (5%W/V aqueous solution) and 0.05ml of test solution.
2. Test control solution (0.5ml) consist of 0.45ml of bovine serum albumin (5%W/V aqueous solution) and 0.05ml of distilled water.
3. Product control (0.5ml) consists of 0.45ml of distilled water and 0.05ml of test solution.
4. Standard solution (0.5ml) consists of 0.45ml of Bovine serum albumin (5%W/V aqueous solution) and 0.05ml of Diclofenac sodium.

Various concentrations (50, 100, 250, 500, 1000, 2000 µg/ml) of plant extracts (test solution) and diclofenac sodium (standard) were taken respectively. All the above solutions were adjusted to pH 6.3 using 1N HCl. The samples were incubated at 37°C for 20 minutes and the temperature was increased to keep the samples at 57°C for 3 minutes. After cooling, add 2.5 ml of phosphate buffer to the above solutions. The absorbance was measured using UV-Visible spectrophotometer at 416nm.

The control represents 100% protein denaturation. The results were compared with Diclofenac sodium. The percentage inhibition of protein denaturation of different concentrations was tabulated in Table 1 & Figure 1.

The percentage inhibition of protein denaturation can be calculated as-

\[
\% \text{ of Inhibition} = \left(100 - \frac{(\text{O.D of test solution} - \text{O.D of product control})}{\text{O.D of test control}}\right) \times 100.
\]

The control represents 100% protein denaturation. The results were compared with Diclofenac sodium.

Effect on membrane stabilisation / Inhibition of membrane lysis

The principle involved here is stabilization of human red blood cell (HRBC) membrane by hypotonicity induced membrane lysis. The assay mixture contains 1ml phosphate buffer [pH 7.4, 0.15 M], 2ml hypo saline [0.36 %], 0.5 ml HRBC suspension [10% v/v] with 0.5 ml of plant extracts and standard drug diclofenac sodium of various concentrations (50, 100, 250, 500, 1000, 2000 µg/ml) and control (distilled water instead of hypo saline to produce 100% hemolysis) were incubated at 37°C for 30 min and centrifuged respectively. The haemoglobin content in the suspension was estimated using spectrophotometer at 560 nm. The percentage of membrane stabilisation at different concentrations was tabulated in Table 1 and shown in Figure 2.

The percentage inhibition of membrane stabilisation can be calculated as-

\[
\% \text{ of Inhibition} = 100 - \left(\frac{\text{O.D of test solution}}{\text{O.D of control}}\right) \times 100.
\]

RESULTS AND DISCUSSIONS

The methanolic extract of B. monniera has showed significant activity at various concentrations and its effect was compared with the standard drug Diclofenac sodium. The maximum percentage inhibition of protein denaturation and membrane stabilisation of B. monniera was observed as 90.34±0.83% and 93.67±1.34% at 2000µg/ml respectively as shown in Table 1. When compared to standard Diclofenac sodium was found out to be
96.52±1.25% and 98.76±1.67% respectively at a dose of 2000µg/ml. The production of auto antigen in certain arthritic disease may be due to denaturation of protein and membrane lysis. From the results (Figure 1 and 2) of our present study, it can be stated that methanolic extracts are capable of controlling the production of auto antigen and inhibits denaturation of protein and membrane lysis in rheumatic disease.

**CONCLUSION**

Inhibition of protein denaturation and membrane stabilisation was studied to establish the mechanism of anti-arthritic effect of *B. monnieri*. Therefore, our present *in-vitro* studies on *B. monnieri* extracts demonstrated the significant anti-arthritic activity. Due to the presence of active principles such as flavonoids, bacosides and triterpenoids and related polyphenols may responsible for this activity. Hence, *B. monnieri* can be used as a potent anti-arthritic agent.
